A. Two Sum Trouble

time limit per test: 1 second

memory limit per test: 256 megabytes

Forbidden Keywords for the Quiz: open, file, creat(, fstream, thread, process, system(, exec(

Your little brother, Bob, loves playing with integers. One day, his teacher gave him a sorted list of N integers in **non-decreasing** order. Now, your brother wants to play a game with you.

Bob will give you an integer S . You have to find if it is possible to find two values from the list (at distinct positions) whose sum is equal to S .

Since you are feeling very tired, you decide to write a program that can quickly answer Bob's query.

Input

The first line contains two integers N ($1 \leq N \leq 10^6$) and S ($1 \leq S \leq 10^9$), denoting the length of the list, and the target Sum.

In the next line, there will be N integers $a_1, a_2, a_3 \dots a_n$ ($1 \leq a_i \leq 10^9$) in non-decreasing order, separated by spaces.

Output

Print two distinct 1-based indices i and j such that $a_i + a_j = S$ where $i < j$. If no such pair exists, then print **-1**. If multiple solutions exist, you may print any one of the valid answers.
